Analyzing Likert Data

The analyses of Likert-type and Likert scale data require unique data analysis procedures, and as a result, misuses and/or mistakes often occur. This article discusses the differences between Likert-type and Likert scale data and provides recommendations for descriptive statistics to be used during the analysis.

A Likert item typically refers to a single question for which the response is indicated on a discrete ordered scale ranging from one qualitative end point to another qualitative end point (e.g., strongly disagree to strongly agree). Likert items typically have 5 to 11 discrete response options. Ordinal data do not have metric information.

The long-running issue with Likert-type scales and ordinal responses is the appropriate statistical treatment of these data. If the data are ordinal, then non-parametric statistics are typically considered the most appropriate option for analysis. If the data are interval, then parametric statistics can be used.
